GAJSHIELD

Bug Fixes:

1. Added validation to prevent the addition of network or broadcast IP addresses in the host tab.
2. Resolved an issue where editing the netmask of an interface configured as DHCP was restricted. Now, users can edit the netmask of a DHCP interface as needed.
3. Implemented validation to disallow the use of loopback addresses in the network IP field of the network tab.
4. Added validation to not allow duplicate entry of host ranges. This ensures that each host range is unique, avoiding configuration conflicts.
