**GAJSHIELD**

### Enhancement:

1. In the admin management tab, when adding a new admin user, renaming the 'admin type' field to 'authentication type' enhances clarity and consistency in user administration.

### Bug Fixes:

1. When accessing reports, clicking on app filter reports redirects to browsing reports instead of the intended destination. This redirection issue needs to be addressed to ensure proper navigation within the reporting system.
2. Previously, logs related to VLAN activities had incorrect labels. This has been improved to ensure correct logging and monitoring of VLAN activities.
3. The dashboard displayed the antivirus service as active even when disabled, causing confusion. This has been enhanced to ensure proper display of the antivirus service status.
