

**Release Date: 27<sup>th</sup> September, 2016**

## **Release Notes**

1. License synchronization introduced in GajShield web UI to pull all registered licenses from <https://license.gajshield.com> into an appliance. It will remove manual intervention to upload a license.

To synchronize license, go to Management → License → Update License

2. Support for SSL, TLS introduced under email settings for email alert configuration. Along with this, configurable option for SMTP server domain name and SMTP server port is also introduced (Management → Settings → Email Settings).
3. Two Factor Authentication now enabled for GajShield superuser CLI console.
4. Top App Users report included in Top Reports to view user-wise application usage reports (Top Reports under Top Menu → Top App Users).
5. Configure keyword phrase to block MIME (Browsing → Mimes And File Extns → Mimetypes).
6. LDAP user/group synchronization introduced (Configuration → User Management → Ldap).
7. Provided option to add required firewall rules to establish IPSec VPN tunnel and access remote network vice-versa while adding new IPSec VPN tunnel (VPN → IPsec → Tunnels, here when you click ADD button to add new tunnel then you will find “Automatic Firewall Rules” checkbox option).
8. Mobile users will get “Sign-in to network” option when they connect to open wi-fi network where GajShield userSense authentication is enabled.

### **Bug fixes and Enhancements:**

1. Uploading subscription service license is not allowed if appliance license is not updated on the appliance.
2. UserSense Binding now allow to bind a user with multiple IP/MAC addresses (Browsing → UserSense → UserSense Binding).
3. App Policy will not allow to add new App Filter Policy if “App Filter Policy Name” is already exists with the same name (App Filter → App Policy).
4. Demo license now includes 5 number of enterprise cloud client license.
5. Facebook chat block problem in DLP is now resolved.
6. Sender email id missing in Gmail web mail DLP logs is now resolved.

7. QoS queue name will now allow queue name upto 16 characters (Definitions → QoS → Queues).
8. No need to create DNS failover firewall rule explicitly, now it's created automatically if there are more than one ISP configured and working.
9. Manually created firewall configuration backup stored on appliance is limited to 5 numbers (Management → Backup → Backup).
10. Firewall Rules move (up/down) problem is now resolved.
11. GajShield Web interface slow response when email alert for admin activity on web UI is configured, now resolved.
